Question 1

Correct

Marked out of 5.00

Write a program to find whether the given input number is Odd.

If the given number is odd, the program should return 2 else it should return 1.

Note: The number passed to the program can be either be negative, positive or zero. Zero should NOT be treated as Odd.

For example:

In p ut	Re sul t
12	2
3	
4	1
5	
6	

Answer: (penalty regime: 0%)

```
1 import java.io.*;  
import java.util.*;
```

```
2
```

```

3 publicclassOdd{
4 publicstaticvoidmain(String[] args)
5 {
6 Scanner sc=new Scanner(System.in);
7 int a=sc.nextInt();
8 if(a% 2==1||a% 2== - 1)
9 {
10 System.out.println(2);
11 }
12 elseif(a% 2==0)
13 {
14 System.out.println(1);
15 }
16 elseif(a==0)
17 {
18 System.out.println(1);
19 }
20 }
21 }

```

Passed all tests!✓

Write a program that returns the last digit of the given number. Last digit is being referred to the least significant digit i.e. the digit in the ones (units) place in the given number.

The last digit should be returned as a positive number. For example,

if the given number is 197, the last digit is 7 if the given number is - 197, the last digit is 7 For example:

In	Re
----	----

p ut	su l t
19 7	7
- 1 9 7	7

Answer:(penaltyregime:0%)

```

1  import java.io.*;
   import java.util.*;

2

3  import java.math.*;
4  public class Last{
5      public static void main(String[] args)
6      {
7          Scanner sc = new Scanner(System.in);
8          int a = sc.nextInt();
9          int b = sc.nextInt();
10         int c = Math.abs(a);
11         System.out.println(a%10);
12     }

Question3

Correct

Marked out of 5.00

Rohit wants to add the last digits of two given numbers. For example, If the given numbers are 267 and 154, the output should be 11. Below is the explanation:

Last digit of the  
267 is 7

Last digit of the  
154 is 4

Sum of 7  
and 4 = 11

Write a program to help Rohit achieve this for any given two numbers. Note: The sign of the input numbers should be ignored. i.e.

If the input numbers are 267 and 154, the sum of last two digits should be 11. If the input numbers are 267 and -154, the sum of last two digits should be 11. If the input numbers are -267 and 154, the sum of last two digits should be 11. If the input numbers are -267 and -154, the sum of last two digits should be 11.

For example:

In p ut	Re sul t
267154	11
2	11

6	
7	
- 1	
5	
4	
- 2	11
6	
7	
15	
4	
- 2	11
6	
7	
- 1	
5	
4

CompletedSunday, 22 September 2024, 9:43 PM

Duration1 hour 9 mins

Question1

Correct

Marked out of 5.00

You are provided with a set of numbers (array of numbers).

You have to generate the sum of specific numbers based on its position in the array set provided to you. This is explained below:

Example 1:

Let us assume the encoded set of numbers given to you is:

input1: 5 and input2: {1, 51, 436, 7860, 41236}

Step 1:

Starting from the 0<sup>th</sup> index of the array, pick up digits as per below:

0<sup>th</sup> index – pick up the units value of

the number (in this case is 1). 1<sup>st</sup> index-

pick up the tens value of the number (in this case it is 5).

2<sup>nd</sup> index - pick up the hundreds value of the number (in this case it is 4). 3<sup>rd</sup> index - pick

up the thousands value of the number (in this case it is 7).

4<sup>th</sup> index-

pick up the ten thousands value of the number (in this case it is 4). (Continue this for all the elements of the input array).

The array generated from Step 1 will then be – {1, 5, 4, 7, 4}.

Step 2:

Square each number present in the array generated in Step 1.

{1, 25, 16, 49, 16}

Step3:

Calculate the sum of all elements of the array generated in Step 2 to get the final result. The result will be = 107. Note:

- 1) While picking up a number in Step 1, if you observe that the number is smaller than the required position then use 0.
- 2) In the given function, input1[] is the array of numbers and input2 represents the number of elements in input1. Example 2:

input1: 5 and input2: {1, 5, 423, 310, 61540}

Step1:

Generating the new array based on position, we get the below array:

{1, 0, 4, 0, 6}

In this case, the value in input1 at index 1 and 3 is less than the value required to be picked up based on position, so we use 0. Step 2:

{1, 0, 16, 0, 36}

Step3:

The final result = 53.

For example:

Input	Result
5 1 5 1 4 3 6 7 8 6 0 4 1 2 3 6	107
5 1 5 4 2 3 3 1 0 6 1 5 4 0	53

Answer:(penaltyregime:0%)

```
1 import
  java.io.*;
  import java.util.
2 *;
  public class arraysp{
3     public static void main(String[] args)
        {
4         Scanner sc=new Scanner(System.in);
5     }
```

7			<code>int sum=0;</code>
8			<code>int n=sc.nextInt();</code>
9			<code>int[] arr=new int[n];</code>
10			<code>for(int i=0;i&lt;n;i++)</code>
11			<code>{</code>
12			<code>arr[i]=sc.nextInt();</code>
13			<code>}</code>
14			<code>int[] p=new int[n];</code>
15			<code>for(int i=0;i&lt;n;i++)</code>
16			<code>{</code>
17			<code>p[i]=(arr[i]/(int)</code> <code>Math.pow(10,i)) % 10;</code>
18			<code>}</code>
19			<code>for(int i:p)</code>
20			<code>{</code>
21			<code>sum+=i*i;</code>
22			<code>}</code>
23			<code>System.out.println(sum);</code>

Question2

Correct

Marked out of 5.00

Given an integer array as input, perform the following operations on the array, in the below specified sequence.

1. Find the maximum number in the array.
2. Subtract the maximum number from each element of the array.
3. Multiply the maximum number (found in step 1) to each element of the resultant array. After the operations are done, return the resultant array.

Example 1:

input1=4 (represents the number of elements in the input1 array) input2 = {1, 5, 6, 9}

Expected Output = {-

72, -36, 27, 0}

Explanation:

Step1: The maximum number in the given array is 9.

Step2: Subtracting the maximum number 9 from each element of the array:

{(1 - 9), (5 - 9), (6 - 9), (9 - 9)} = {-8, -4, -3, 0}

Step3: Multiplying the maximum number 9 to each of the resultant array:

{(-8 x 9), (-4 x 9), (3 x 9), (0 x 9)} = {-72, -36, -27, 0}

So, the expected output is the resultant array {- 72, - 36, - 27, 0}.

Example 2:

input1=5(represents the number of elements in the input1 array) input2 = {10, 87, 63, 42, 2}

Expected Output = {- 6699, 0, - 2088, - 3915, - 7395}

Explanation:

Step1: The maximum number in the given array is 87.

Step2: Subtracting the maximum number 87 from each element of the array:

$\{(10 - 87), (87 - 87), (63 - 87), (42 - 87), (2 - 87)\} = \{- 77, 0, - 24, - 45, - 85\}$

Step3: Multiplying the maximum number 87 to each of the resultant array:

$\{(- 77 \times 87), (0 \times 87), (- 24 \times 87), (- 45 \times 87), (- 85 \times 87)\} = \{- 6699, 0, - 2088, - 3915, - 7395\}$

So, the expected output is the resultant array {- 6699, 0, - 2088, - 3915, - 7395}.

Example 3:

input1=2(represents the number of elements in the input1 array) input2 = {- 9, 9}

Expected Output = {- 162, 0}

Explanation:

Step1: The maximum number in the given array is 9.

Step2: Subtracting the maximum number 9 from each element of the array:

$\{(- 9 - 9), (9 - 9)\} = \{- 18, 0\}$

Step3: Multiplying the maximum number 9 to each of the resultant array:

$\{(- 18 \times 9), (0 \times 9)\} = \{- 162, 0\}$

So, the expected output is the resultant array {- 162, 0}.

Note: The input array will contain not more than 100 elements

For example:

Input	Result
4 1 5 6 9	- 72 - 36 - 27 0

Input	Result
5 10 87 63 42 2	- 6699 0 - 2088 - 3915 - 7395

2 - 9 9	- 162 0
------------	---------

Answer:(penaltyregime:0%)

Question3

Correct

Marked out of 5.00

Given an array of numbers, you are expected to return the sum of the longest sequence of POSITIVE numbers in the array. If there are NO positive numbers in the array, you are expected to return - 1.

In this question's scope, the number 0 should be considered as positive.

Note: If there are more than one group of elements in the array having the longest sequence of POSITIVE numbers, you are expected to return the total sum of all those POSITIVE numbers (see example 3 below).

input1 represents the number of elements in the array. input2

represents the array of integers.

Example 1:

input1 = 16

input2 = {- 12, - 16, 12, 18, 18, 14, - 4, - 12, - 13, 32, 34, - 5, 66, 78, 78, - 79}

Expected output

62

Explanation:

The input array contains four sequences of POSITIVE numbers, i.e. "12, 18, 18, 14", "12", "32, 34", and "66, 78, 78". The first sequence "12, 18, 18, 14" is the longest of the four as it contains 4 elements. Therefore, the expected output = sum of the longest sequence of POSITIVE numbers = 12 + 18 + 18 + 14 = 63.

Example 2:

input1 = 11

input2 = {- 22, - 24, 16, - 1, - 17, - 19, - 37, - 25, - 19, - 93, - 61}

Expected output

tput=- 1

Explanation:

There are NO positive numbers in the input array. Therefore, the expected output for such cases = - 1. Example 3:

input1 = 16

input2 = {- 58, 32, 26, 92, - 10, - 4, 12, 0, 12, - 2, 4, 32, - 9, - 7, 78, - 79}

Expected output

tput=174

Explanation:

The input array contains four sequences of POSITIVE numbers, i.e. "32, 26, 92", "12, 0, 12", "4, 32", and "78". The first and second sequences "32, 26, 92" and "12, 0, 12" are the longest of the four as they contain 4 elements each. Therefore, the expected output = sum of the longest sequence of POSITIVE numbers = (32 + 26 + 92) + (12 + 0 + 12) = 174.

For example:

Input	Result
16 - 12 - 16 12 18 18 14 - 4 - 12 - 13 32 34 - 5 6 6 78 78 - 79	62
11 - 22 - 24 - 16 - 1 - 17 - 19 - 37 - 25 - 19 - 93 - 61	- 1
16 - 58 32 26 92 - 10 - 4 12 0 12 - 2 4 32 - 9 - 7 78 - 79	174

Answer:(penaltyregime:0%)

```
1 import
  java.io.*;
  import java.util.

Question2

Correct

Marked out of 5.00

Create a Class Mobile with the attributes listed below, private String manufacturer; private String operating\_system; public String color; private int cost;

Define a Parameterized constructor to initialize the above instance variables. Define getter and setter methods for the attributes above.

for example : setter method

for manufacturer is void

```
setManufacturer(String  
manufacturer)
```

```
{ this.manufacturer=  
manufacturer;  
}
```

```
String getManu  
facturer()
```

```
{ return  
manufacturer;  
}
```

Display the object details by overriding the toString() method.

For example:

T e s t	Result
1	manufacturer = Redmi operating_syste m=Andriod color = Blue cost=34000

Answer:(penalty regime:0%)

```

1 public class Mobile{
    private String manufacturer;
    private String
2    operating_system; private
    String color;
3    private int cost;
    public Mobile(String manufacturer, String operating_system, String color, int cost)
4    { this.manufacturer=manufacturer;
      this.operating_system=oper
5      ating_system;
      this.color=color;
6      this.cost=cost;
    }
    public void setManufacturer(String manufacturer)
7    {
      this.manufacturer=manufacturer;
8    }
    public String getManufacturer()
9    {
      return manufacturer;
10   }
    public String getOperatingSystem()
11   {
      return operating_system;
12   }
    public void setColor(String color)
13   {
      this.color=color;
14   }
    public void setCost(int cost)
15   {
      this.cost=cost;
16   }
    @Override
    public String toString()
17   {
      return "manufacturer="+manufacturer+"\noperating_system="+operating_sy
18      stem+"\ncolor="+color+"\nc
19   }
    public static void main(String[] args)
20   {
      Mobile mobile=new Mobile("Redmi", "Andriod", "Blue", 34000);
21   }
}

```

Question 1

Correct

Marked out of 5.00

Create a class known as "BankAccount" with methods called deposit() and withdraw(). Create a subclass called SavingsAccount that overrides the withdraw() method to prevent withdrawal if the account balance falls below one hundred.

For example:

## Result

Create a BankAccount object(A/c No. BA1234) with initial balance of \$500: Deposit \$1000 into account BA1234:  
New balance after depositing \$1000: \$1500.0  
Withdraw \$600 from account BA1234:  
New balance after withdrawing \$600: \$900.0

Answer:(penalty regime:0%)

Reset answer

Question1

Correct

Markedoutof 5.00

Given a String input1, which contains many number of words separated by : and each word contains exactly two lower case alphabets, generate an output based upon the below 2 cases.

Note:

1. Allthecharactersininput1arelowercasealphabets.
2. input1willalwayscontainmorethanonewordseparatedby:
3. Outputshouldbereturn

edinuppercase. Case 1:

Checkwhetherthetwoalphabetsaresame.

If yes, then take one alphabet from it

and add it to the output. Example 1:

input1=ww:i

i:pp:rr:oo

output =

WIPRO

Explanation:

word1 is ww, both are

same hence take w

word2 is ii, both are

same hence take i word3

is pp, both are same

hence take p word4 is rr,

both are same hence  
take r word5 is oo, both  
are same hence take o  
Hence the output is

WIPRO

Case2:

If the two alphabets are not same, then find the position value of them  
and find maximum value – minimum value. Take the alphabet which  
comes at this (maximum value - minimum value) position in the  
alphabet series.

Exempl

e 2"

input1=z

x:za:ee

output

= BYE

Explanat

ion

word1iszx,botharenotsamea

lphabets position value of z

is 26

positionvalueofxis24

max- minwillbe26- 24=2

Alphabet which comes

in 2<sup>nd</sup> position is b

Word2 is za, both are

not same alphabets

position value of z is 26

positionvalueofais1

max- minwillbe26- 1=25

Alphabet which comes in

25<sup>th</sup> position is y word3 is

ee, both are same hence

take e Hence the output

is BYE

Forexample:

Input	Result
ww:ii:pp :rr:oo	WI PR O
zx:za:ee	BY E

Answer:(penaltyregime:0%)

Question2

Correct

Marked out of 5.00

Given 2 strings input1 & input2.

- Concatenate both the strings.
- Remove duplicate alphabets & whitespaces.
- Arrange the alphabets in descending order.

Assumption 1:

There will either be alphabets, white spaces or null in both the inputs. Assumption 2:

Both inputs will be in lowercase.

Example 1:

Input1: apple

Input 2:

orange

Output:rpo

nlgea

Example

2:

Input 1:

fruits

Input2:ar

egood

Output:utsr

oigfeda

Example 3:

Input1:""

Input 2:

""

Output:n

ull

Forexample:

T e s t	Inpu t	Result
1	apple orange	rponl gea
2	fruit s are goo d	utsroi gfeda

Question3

Correct

Marked out of 5.00

You are provided a string of words and a 2- digit number. The two digits of the number represent the two words that are to be processed. For example:

If the string is "Today is a Nice Day" and the 2- digit number is 41, then you are expected to process the 4th word ("Nice") and the 1st word ("Today").

The processing of each word is to be done as follows:

Extract the Middle- to- Begin part: Starting from the middle of the word, extract the characters till the beginning of the word. Extract the Middle- to- End part: Starting from the middle of the word, extract the characters till the end of the word.

If the word to be processed is "Nice":

Its Middle- to-

Begin part will be "iN".

Its Middle- to- End

part will be "ce".

So, merged together these two parts would form "iNce".

Similarly, if the word to be processed is "Today":

Its Middle- to-

Begin part will be "doT".

Its Middle- to- End

part will be "day".

So, merged together these two parts would form "doTday".

Note: Note that the middle letter 'd' is part of both the extracted parts. So, for words whose length is odd, the middle letter should be included in both the extracted parts.

Expected output:

The expected output is a string containing both the processed words separated by a space "iNcedoTday" Example 1:

```
input1="TodayisaNic
eDay" input2 = 41
output="iNced
oTday"
```

Example 2:

```
input1 = "Fruits like Mango and Apple are
common but Grapes are rare" input2 = 39
output="naMngoarGpes"
```

Note: The input string input1 will contain only alphabets and a single space character separating each word in the string. Note: The input string input1 will NOT contain any other special characters.

Note: The input number input2 will always be a 2- digit number ( $\geq 11$  and  $\leq 99$ ). One of its digits will never be 0. Both the digits of the number will always point to a valid word in the input1 string.

Forexample:

Input	Result
TodayisaN iceDay 41	iNcedo Tday
Fruits like Mango and Apple are common but Grapes are rare 39	naMng oarGpe s

Answer:(penaltyregime:0%)

1	<code>import java.util.Scanner;</code>

Question1

Correct

Marked out of 5.00

create an interface Playable with a method play() that takes no arguments and returns void. Create three classes Football, Volleyball, and Basketball that implement the Playable interface and override the play() method to play the respective sports.

```

interface Playable {
    void play();
}

class Football implements Playable {
    String name;
    public Football(String name) {
        this.name = name;
    }
    public void play() {
        System.out.println(name + "isPlaying football");
    }
}

```

Similarly, create Volleyball and Basketball classes.

Sample output:

Sadhvin is Playing football

For example:

Test	Input	Result
1	Sadhvin Sanjay Sruthi	Sadhvin is Playing football Sanjay is Playing volleyball Sruthi is Playing basketball
2	Vijay Arun	Vijay is Playing football Arun is Playing volleyball Balaji is Playing basketball

	B al aji	sketball
--	----------------	----------

Answer:(penaltyregime:0%)

1	import java.util.Scanner;
2	
3	interface Playable
4	{
5	void play();
6	}
7	
8	class Football implements Playable {
9	String name;
10	
11	public Football(String name)
12	{
13	this.name = name;
14	}
15	
16	public void play()
17	{
18	System.out.println(name + " is Playing football");

1 9	}
2 0	}
2 1	
2 2	class Volleyball implements Playable
23	{

Question2

Correct

Marked out of 5.00

```
Create interfaces shown below. interface
Sports {
public void
setHomeTeam(String
name);
public void setVisitingTe
am(String name);
}
interface Football
extends Sports
{public void homeTeam
Scored(int points);
public void visitingTeamScored(int points);}
create a class College that implements the Football interface and provides the necess
ary functionality to the abstract methods. sample Input:
```

```
Rajal
aksh
mi
Save
etha
22
21
```

Output:

```
Rajalakshmi 22 scored
Saveetha 21
scored
Rajalakshmi is the
winner!
```

For example:

T e s t	Input	Result
1	Rajalakshmi  Saveetha 22 21	Rajalakshmi 22 scored Saveetha 21 scored Rajalakshmi is the winner!

Question3

Correct

Marked out of 5.00

RBI issues all national banks to collect interest on all customer loans.

Create an RBI interface with a variable String parentBank="RBI" and abstract method rateOfInterest(). RBI interface has two more methods default and static method.

```
default void policyNote() {
```

```
System.out.println("RBI has a new Policy issued in 2023.");
```

```
}
```

```
static void regulations(){
```

```
System.out.println("RBI has updated new regulations in 2024.");
```

```
}
```

Create two subclasses SBI and Karur which implement

the RBI interface. Provide the

necessary code for the abstract method in

two sub-classes. Sample Input/Output:

RBI has a new Policy issued in 2023

RBI has updated new regul

ations in 2024. SBI rate of

interest: 7.6 per annum.

Karur rate of interest: 7.4 per annum.

For example:

T e s t	Result
1	RBI has a new Policy issued in 2023 RBI has updated new regulations in 2024. SBI rate of interest: 7.6 per annum. Karur rate of interest: 7.4

per annum.

Answer:(penaltyregime:0%)

1	<code>interface RBI</code>
2	<code>{</code>
3	<code>String parentBank= "RBI";</code>
4	
5	<code>double rateOfInterest();</code>
6	
7	<code>default void policyNote()</code>
8	<code>{</code>
9	<code>System.out.println("RBI has a new Policy issued in 2023");</code>
10	<code>}</code>
11	
12	<code>static void regulations()</code>
13	<code>{</code>
14	<code>System.out.println("RBI has updated new regulations in 2024.");</code>
15	<code>}</code>
16	<code>}</code>
17	
18	<code>class SBI implements RBI</code>

19	{
2 0	public double rateOfInterest()
21	{
2 2 2	return 7.6;
2 3	}
2 4	}
2 5	
2 6	class Karur implements RBI
27	{
2 8	public double rateOfInterest()
29	{
3 0	return 7.4;
3 1	}
3 2	}
3 3	
3 4	public class test
35	{
3 6	public static void main(String[] args)

37	{
----	---

38		SBI sbiBank= new SBI();
39		Karur karurBank= new Karur();
40		
41		sbiBank.policyNote();
42		RBI.regulations();
43		
44		System.out.println("SBI rate of interest: " + sbiBank.rateOfInterest() + " per annum.");
45		System.out.println("Karur rate of interest: " + karurBank.rateOfInterest() + " per annum.");
46	}

Question1

Correct

Marked out of 5.00

### 1. FinalVariable:

- Once a variable is declared **final**, its value cannot be changed after it is initialized.
- It must be initialized when it is declared or in the constructor if it's not initialized at declaration.
- It can be used to define constants

```
final int MAX_SPEED = 120; // Constant value, cannot be changed
```

## 2. FinalMethod:

- A method declared **final** cannot be overridden by subclasses.
- It is used to prevent modification of the method's behavior in derived classes.

```
public final void display()  
{ System.out.println("This is  
a final method.");  
}
```

## 3. FinalClass:

- A class declared as **final** cannot be subclassed (i.e., no other class can inherit from it). It is used to prevent a class from being extended and modified.
- ```
public final class Vehicle {  
    // class code  
}
```

Given a Java Program that contains the bug in it, your task is to clear the bug to the output. you should delete any piece of code.  
For example:

| T<br>e<br>s<br>t | Result                                                                      |
|------------------|-----------------------------------------------------------------------------|

Question2

Correct

Marked out of 5.00

Create a base class Shape with a method called calculateArea(). Create three subclasses: Circle, Rectangle, and Triangle. Override the calculateArea() method in each subclass to calculate and return the shape's area.

In the given exercise, here is a simple diagram illustrating polymorphism implementation:

```

abstract class Shape {
    public abstract double calculateArea() ;
}

```

```

System.out.printf("Area of a Triangle: %.2f\n",
((0.5)*base*height)); // use this statement sample Input :
4 // radius of the circle to calculate area PI*r*r

```

5//length of the rectangle

6// breadth of the rectangle to calculate the area of a rectangle

4//base of the triangle

3//height of the triangle

OUTPUT:

Area of a

circle :50.27

AreaofaRectan

gle:30.00

Area of a

Triangle :6.00

For example:

| T<br>e<br>s<br>t | In<br>p<br>ut | Result                           |
|------------------|---------------|----------------------------------|
| 1                | 4             | Area of a circle:<br>50.27       |
|                  | 5             | Area of a<br>Rectangle:<br>30.00 |
|                  | 6             | Area of a<br>Triangle: 6.00      |
|                  | 4             |                                  |
|                  | 3             |                                  |

Question3

Correct

Marked out of 5.00

As a logic building learner you are given the task to extract the string which has vowel as the first and last characters from the given array of Strings.

Step 1: Scan through the array of Strings, extract the Strings with first and last characters as vowels; these strings should be concatenated. Step 2: Convert the concatenated string to lowercase and return it.

If none of the strings in the array has first and last character as vowel, then return no matches found  
input1: an integer representing the number of elements in the array.

input2: String

array.

Example 1:

input1: 3

input2:

{" oreo" , " sirish"  
," apple" } output:

oreoapple

Example 2:

input1: 2

input2:

{" Mango" , " ban  
ana" } output: no

matches found

Explanation:

None of the strings has first and last character as vowel.

Hence the output is no match

has found. Example 3:

input1: 3

input2:

{ "Ate" , "Ace"

"e" , "Girl" }

output: ateace

For example:

| Input                        | Result                 |
|------------------------------|------------------------|
| 3<br>oreo<br>sirish<br>apple | oreoappl<br>e          |
| 2<br>Mango<br>banana         | no<br>matches<br>found |
| 3<br>Ate Ace<br>Girl         | ateace                 |

Answer:(penaltyregime:0%)

Duration 6mins 17secs

Question 1

Correct

Marked out of 5.00

In the following program, an array of integer data is to be initialized.

During the initialization, if a user enters a value other than an integer, it will throw an `InputMismatchException` exception. On the occurrence of such an exception, your program should print " You entered bad data."

If there is no such exception it will print the total sum of the array.

```
/*Define try- catch block to save user input in the array "name"
```

```
If there is an exception then catch the exception otherwise print the total sum of the array.*/
```

Sample Input:

3

5 21

Sample Output:

8

Sample Input:

2

1g

Sample Output:

You entered bad data

For example:

| In<br>p<br>ut | Result                |
|---------------|-----------------------|
| 3<br>5<br>21  | 8                     |
| 2<br>1<br>g   | You entered bad data. |

Answer: (penalty regime: 0%)

Reset

answer

```
1 import java.util.Scanner;
2 import java.util.InputMismatchException;
3 class prog{
4     public static void main(String[] args){
5         Scanner sc = new Scanner(System.in);
6         int length = sc.nextInt();
7         int[] name = new int[length];
8         int sum = 0;
9         try
10        {
11            for(int i = 0; i < length; i++){
12                name[i] = sc.nextInt();
13                sum += name[i];
14            }
15            System.out.println(sum);
16        }
17        catch (InputMismatchException e)
18        {
19            System.out.println("You entered bad data.");
20        }
21    }
22 }
```

|   | In<br>pu<br>t | Expected | Got |   |

| ✓ | 3<br>5<br>21  | 8        | 8   | ✓ |

|   | In<br>pu<br>t | Expected              | Got                   |   |
|---|---------------|-----------------------|-----------------------|---|
| ✓ | 2<br>1<br>g   | You entered bad data. | You entered bad data. | ✓ |

Passed all tests! ✓

## Question2

Correct

Marked out of 5.00

Write a Java program to handle `ArithmeticException` and `ArrayIndexOutOfBoundsException`. Create an array, read the input from the user, and store it in the array.

Divide the 0th index element by the 1st index element and store it. if the 1st element is zero, it will throw an

exception.

if you try to access an element beyond the array limit it throws an exception.

Input:

5

100203040

Output:

java.lang.ArithmeticException:/by zero I am always executed

Input:

3

102030

Output

java.lang.ArrayIndexOutOfBoundsException: Index 3 out of bounds for length 3 I am always executed

For example:

| T<br>e<br>s<br>t | Input          | Result                                 |

Question3

Correct

Marked out of 5.00

Write a Java program to create a method that takes an integer as a parameter and throws an exception if the number is odd.

Sample input and Output:

82 is even.

Fill the preloaded answer to get the expected output.

For example:

Result

82 is even.

Answer:(penaltyregime:0%)

Given an ArrayList, the task is to get the first and last element of the ArrayList in Java.

Input: ArrayList = [1, 2, 3, 4]

Output: First = 1, Last = 4

Approach:

1. Get the ArrayList with the elements.
2. Get the first element of ArrayList using the get(index) method by passing index = 0.
3. Get the last element of ArrayList using the get(index) method by passing index = size - 1.

Answer: (penalty regime: 0%)

The given Java program is based on the ArrayList methods and its usage. The Java program is partially filled. Your task is to fill in the incomplete statements to get the desired output.

list.set();

list.indexO

f());

list.lastInd

exOf())

list.contai

ns()

list.size());

list.add();

list.remov

e());

The above methods are used for the below Java program.

Question1

Correct

Marked out of 1.00

JavaHashSet class implements the Set interface, backed by a hashtable which is actually a [HashMap](#) instance.

No guarantee is made as to the iteration order of the hash sets which means that the class does not guarantee the constant order of elements over time.

This class permits the null element.

The class also offers constant time performance for the basic operations like add, remove, contains, and size assuming the hash function disperses the elements properly among the buckets.

### JavaHashSet Features

A few important features of HashSet are mentioned below:

- Implements [Set Interface](#).
- The underlying data structure for HashSet is [Hashtable](#).
- As it implements the Set Interface, duplicate values are not allowed.
- Objects that you insert in HashSet are not guaranteed to be inserted in the same order. Objects are inserted based on their hashcode.
- NULL elements are allowed in HashSet.

```
public class HashSet<E> extends AbstractSet<E> implements Set<E>  
>, Cloneable, Serializable
```

 Sample Input and Output:

```
5  
90  
56  
45  
78  
25  
78
```

Sample Output:

```
78 was found in the  
set.
```

HashSet also implements Serializable and Cloneable interfaces.

Question2

Correct

Marked out of 1.00

Write a Java program to compare two sets and retain elements that are the same.

Sample Input and Output:

5

Foo

tball

Hoc

key

Cric

ket

Voll

eyb

all

Bas

ketb

all

7// HashSet 2:

Golf

Cric

ket

Bad

mint

on

Foo

tball

Hoc

key

Voll

eyb

all

Han

dbal

I

SAMPLE OUTPUT:

Foo  
tball

Hoc  
key  
Cric  
ket  
Voll  
eyb  
all  
Bas  
ketb  
all

Question3

Correct

Marked out of 1.00

Java HashMap Methods

[containsKey\(\)](#) Indicate if an entry with the specified key exists in the map

[containsValue\(\)](#) Indicate if an entry with the specified value exists in the map

[putIfAbsent\(\)](#) Write an entry into the map but only if an entry with the same key does not already exist [remove\(\)](#) Remove an entry from the map

[replace\(\)](#) Write to an entry in the map

[onlyIfExistssize\(\)](#) Return the number of entries in the map

Your task is to fill the incomplete code to get the desired output

Answer: (penalty regime: 0%)

Question1

Correct

Marked out of 5.00

Write a function that takes an input String (sentence) and generates a new String (modified sentence) by reversing the words in the original String, maintaining the words position.

In addition, the function should be able to control the reversing of the case (upper or lowercase) based on a case\_option parameter, as follows:

If case\_option = 0, normal reversal of words i.e., if the original sentence is " WiproTechNologiesBangalore" , then the new reversed sentence should be " orpiW seigolonhceTeroLagnaB" .

If case\_option = 1, reversal of words with retaining position' s case i.e., if the original sentence is " WiproTechNologiesBangalore" , then the new reversed sentence should be " OrpiwSeigolonhceTeroLagnaB" .

Note that positions 1, 7, 11, 20 and 25 in the original string are uppercase W, T, N, B and L. Similarly, positions 1, 7, 11, 20 and 25 in the new string are uppercase O, S, O, E and G. NOTE:

1. Only space characters should be treated as the word separator i.e., " HelloWorld" should be treated as two separate words, " Hello" and " World" . However, " Hello,World" , " Hello;World" , " Hello- World" or " Hello/World" should be considered as a single word.
2. Non- alphabetic characters in the String should not be subjected to case changes. For example, if case option = 1 and the original sentence is " WiproTechNologies,Bangalore" then the new reversed sentence should be " Orpiw,seiGolonhceTErolagnab" . Note that comma has been treated as part of the word " Technologies," and when comma had to take the position of uppercase T it remained as a comma and uppercase T took the position of comma. However, the words " Wipro and Bangalore" have changed to " Orpiw" and " Erolagnab" .
3. Kindly ensure that no extra (additional) space characters are embedded within the resultant reversed String. Examples:

| S. No | input1                      | input2 | output                       |
|-------|-----------------------------|--------|------------------------------|
| 1     | WiproTechnologiesBangalore  | 0      | orpiW seigolonhceTeroLagnaB  |
| 2     | WiproTechnologies,Bangalore | 0      | orpiW ,seigolonhceTeroLagnaB |
| 3     | WiproTechnologiesBangalore  | 1      | OrpiwSeigolonhceTeroLagnab   |
| 4     | WiproTechnologies,Bangalore | 1      | Orpiw ,seigolonhceTErolagnab |

For example:

| Input                             | Result                           |
|-----------------------------------|----------------------------------|
| WiproTechnologi<br>esBangalore 0  | orpiW seigolonhce<br>TerolagnaB  |
| WiproTechnologi<br>es,Bangalore 0 | orpiW ,seigolonhc<br>eTerolagnaB |
| WiproTechnologi<br>esBangalore 1  | OrpiwSeigolonhce<br>tErolagnab   |
| WiproTechnologi<br>es,Bangalore 1 | Orpiw ,seigolonhc<br>eTErolagnab |

Question2

Correct

Marked out of 5.00

You are provided with a string which has a sequence of 1's and 0's.

This sequence is the encoded version of an English word. You are supposed to write a program to decode the provided string and find the original word.

Each alphabet is represented by

a sequence of 0's. This is as

mentioned below:

Z : 0

Y : 00

X : 000

W : 0000

V:00000

U:000000

T:0000000

and so on upto A having 26 0's (000000000000000000000000000000).

These sequence of 0's in the encoded form are separated by a single 1 which helps to distinguish between 2 letters. Example 1:

input1: 010010001

The decoded string (original word) will be: ZYX

Example 2:

input1: 0000100000000000000000001000000000001000000000010000000000001

The decoded string (original word) will be: WIPRO

Note: The decoded string must always be in UPPER case.

For example:

| Input                                                         | Result |
|---------------------------------------------------------------|--------|
| 010010001                                                     | ZYX    |
| 0000100000000000000000001000000000001000000000010000000000001 | WIPRO  |

Answer:(penaltyregime:0%)

```
1 import java.util.*;

Question3

Correct

Marked out of 5.00

Given two char arrays `input1[]` and `input2[]` containing only lowercase alphabets, extract the alphabets which are present in both arrays (common alphabets).

Get the ASCII values of all the extracted alphabets.

Calculate sum of those ASCII values. Let's call it `sum1` and calculate single digit sum of `sum1`, i.e., keep adding the digits of `sum1` until you arrive at a single digit.

Return that single digit.

Example:

1. Array size ranges from 1 to 10.

2. All the array elements are lower case alphabets.

3. At least one common alphabet will

be found in the arrays. Example 1:

`input1: { 'a', 'b', 'c' }`

`input2:`

`{ 'b',`

`'c' }`

`output:`

8

Explanation:

'b' and 'c' are present in both arrays.

inboththearrays. ASCII  
 value of ' b' is 98 and  
 ' c' is 99.  
 $98 + 99 = 197$   
 $1 + 9 + 7 = 17$   
 $1 + 7 = 8$

For example:

| In<br>p<br>ut | Re<br>sul<br>t |
|---------------|----------------|
|               | 8              |

Answer:(penaltyregime:0%)
